A payment is also stopped outside the trip window, above the per-payment cap, over the remaining budget including the network fee, when the fee cannot be estimated, or as a duplicate within 5 minutes. |

3. Checks recomputed from the records

24 of 24 checks passed

Anchor 1 / 1 · Replay 10 / 10 · Transactions 8 / 8 · Payer & mined 5 / 5

Anchor: the recomputed mandate hash equals the memo of the anchor transaction. Replay: every entry re-run through the policy with spend rebuilt from earlier entries (2 checks each). Transactions: memo, receipt hash, recipient and amount read back from Sepolia (4 each). Payer & mined: the anchor and every payment were sent by the mandate's agent wallet, and each payment was mined and succeeded (1 + 2 per payment). Replay cannot show whether the mandate was paused when a payment was approved; pause and resume are in the server log.

Sum of counted lines equals the recorded spend (\$17.237991) and remaining (\$132.762009). Counted = amount + estimated network fee, for approved, pending and settled payments; stopped and failed lines count \$0.00.

5. Verify and sign off

Amounts are USD. On-chain values are Sepolia test ETH converted at the demo rate **1 ETH = \$4,000** — the same rate scripts/verify.ts uses. No real money moves.

Reconstruct from records alone: download `mandate-man_A_ev1.json` and `ledger-man_A_ev1.json` from the audit page (Evidence → Download records), then run in a clone of the repository:

```
$ npx tsx scripts/verify.ts ~/Downloads/mandate-man_A_ev1.json ~/Downloads/ledger-man_A_ev1.json
```
